

JULY 2013

The Biscayne Bay Coastal Wetlands Project is a component of the Comprehensive Everglades Restoration Plan (CERP). The project goal is to improve the ecology of Biscayne Bay, including the freshwater wetlands, tidal creeks and near-shore habitat. This will be accomplished by adjusting the quantity, quality, timing and distribution of freshwater entering the bay and Biscayne National Park.

PROJECT PURPOSE

The intent of the Biscayne Bay Coastal Wetlands Project is to rehydrate coastal wetlands and reduce freshwater point source discharges to Biscayne Bay. In addition, the project will replace lost overland flow and partially compensate for the reduction in groundwater seepage by redistributing available surface water entering the area from regional canals through a spreader canal system.

The proposed redistribution of freshwater flow across a wide area is expected to restore or enhance freshwater wetlands, tidal wetlands and nearshore bay habitat. Sustained lower-than-seawater salinities are required in tidal wetlands and the nearshore bay to provide nursery habitat for fish and shellfish. The project is expected to create conditions that will be conducive to the reestablishment of oysters and other components of the oyster reef community. Diversion of concentrated freshwater canal discharges, so that they are distributed slowly across a wide area of coastal wetlands, is expected to reestablish productive nursery habitat along the shoreline. It will also reduce the abrupt freshwater discharges that are physiologically stressful to fish and benthic invertebrates in the bay near canal outlets.

PROJECT STATUS

On Sept. 19, 2012, the Record of Decision was signed for the Biscayne Bay Coastal Wetlands Phase 1 Project. The Record of Decision, signed by Assistant Secretary of the Army for Civil Works Jo-Ellen Darcy, has been transmitted to Congress for authorization.

PROJECT LOCATION

The project study area is located along the lower east coast of Florida in Miami-Dade County. The project area is divided into three geographic sub-regions: Deering Estate, Cutler Wetlands and L-31E Wetlands.

TENTATIVELY SELECTED PLAN: ALTERNATIVE O, PHASE 1

The Tentatively Selected Plan, Alternative O, Phase 1, is a subset of the Tentatively Selected Plan O. The first phase incorporates most of the Deering Estate features, including a 100 cubic feet per second (cfs) pump, spreader canal, culverts, and canal improvements. The Cutler Wetlands features include a 400 cfs pump, culverts, a canal and restoration of the Lennar Flowway. The L-31E Flowway/North Canal Flowway features include pumps, a spreader canal and several culvert structures to manage flows between the C-102 Canal, the L-31E Canal, Military Canal, the C-103 Canal and the nearby restoration areas. No construction activities are recommended in the first phase for the Barnes Sound area.
